Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Max is fascinated by prime numbers and the Fibonacci sequence. He wants to combine these two interests by creating a program that outputs the first n prime numbers within the Fibonacci sequence.

Your task is to help Max by writing a program that prints the first n prime numbers in the Fibonacci sequence using a while loop along with the break statement to achieve the desired functionality.

Input Format

The input consists of an integer n, representing the number of prime Fibonacci numbers to generate.

Output Format

The output displays space-separated first n prime numbers found in the Fibonacci sequence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 2 3 5 13 89

Answer

```
def is_prime(num):
    if num<2:
        return False
    for i in range(2,int(num**0.5)+1):
        if num%i==0:
            return False
    return True
def fibonacci_primes(n):
    fib1,fib2=0,1
    count=0
    prime_fibs=[]
    while count<n:
        fib=fib1+fib2
        fib1,fib2=fib2,fib
        if is_prime(fib):
            prime_fibs.append(fib)
            count +=1
    return " ".join(map(str,prime_fibs))
n=int(input().strip())
print(fibonacci_primes(n))
```

Status : Correct

Marks : 10/10

2. Problem Statement

Students are allowed to work on our computer center machines only after entering the correct secret code. If the code is correct, the message

"Logged In" is displayed. They are not allowed to log in to the machine until they enter the correct secret code.

Write a program to allow the student to work only if he/she enters the correct secret code.

Note: Here, secret code means the last three digits should be divisible by the first digit of the number.

Input Format

The input consists of an integer n, which represents the secret code.

Output Format

The output displays either "Logged In" or "Incorrect code" based on the given condition.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 2345

Output: Incorrect code

Answer

```
n=int(input().strip())
first_digit=int(str(n)[0])
last_three_digits=int(str(n)[-3:])
if last_three_digits%first_digit==0:
    print("Logged In")
else:
    print("Incorrect code")
```

Status : Correct

Marks : 10/10

3. Problem Statement

Alex is practicing programming and is curious about prime and non-prime

digits. He wants to write a program that calculates the sum of the non-prime digits in a given integer using loops.

Help Alex to complete his task.

Example:

Input:

845

output:

12

Explanation:

Digits: 8 (non-prime), 4 (non-prime), 5 (prime)

The sum of Non-Prime Digits: $8 + 4 = 12$

Output: 12

Input Format

The input consists of a single integer X.

Output Format

The output prints an integer representing the sum of non-prime digits in X.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 845

Output: 12

Answer

```
def is_prime(digit):  
    """Function to check if a digit is prime"""  
    return digit in {2, 3, 5, 7}  
def sum_of_non_prime_digits(n):
```

```
"""Function to sum non-prime digits of a number"""
total=0
for digit in str(n):
    d=int(digit)
    if not is_prime(d):
        total +=d
return total
x=int(input())
print(sum_of_non_prime_digits(x))
```

Status : Correct

Marks : 10/10

4. Problem Statement

John is tasked with configuring the lighting for a high-profile event, where different lighting modes affect the ambiance of the venue. He can choose from three distinct lighting modes, each requiring a specific adjustment to the initial light intensity:

Ambient Lighting (Mode 1): The intensity level is multiplied by 1.5.
Stage Lighting (Mode 2): The intensity level is multiplied by 2.0.
Spotlight (Mode 3): The intensity level is multiplied by 1.8.

In the event that an invalid mode is provided, the program should output an error message indicating the invalid selection.

Your task is to write a program that reads the selected lighting mode and the initial intensity level, applies the appropriate adjustment, and prints the final intensity.

Input Format

The first line of input is an integer n , representing the lighting mode.

The second line is a floating value m , representing the initial intensity level of the light.

Output Format

The output displays "Intensity: " followed by a float representing the adjusted intensity level, formatted to two decimal places, if the mode is valid.

If the mode is invalid, the output should display "Invalid".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

10.0

Output: Intensity: 15.00

Answer

```
n=int(input(" "))
m=float(input(" "))
if n==1:
    print(f"Intensity: {m*1.5:.2f}")
elif n==2:
    print(f"Intensity: {m*2.0:.2f}")
elif n==3:
    print(f"Intensity: {m*1.8:.2f}")
else:
    print("Invalid")
```

Status : Correct

Marks : 10/10
